

The GU RoboSub Team is a young project that began at Gonzaga 4 years ago and has finally reached the point where we can attend competition for the first time. Comprised of a diverse group of engineers from all skill levels, our primary objective is to learn more about practical hands-on experience while working on a multidisciplinary project, and to enjoy creating something incredibly complicated and fascinating. We are all looking forward to attending the competition, so we can learn more about all the details to pass on to the incoming freshman and build a solid foundation for their success in future competitions. Everything we do is new to the team, but we've taken each challenge in stride to build a team that will continue to gain momentum and become a prevalent entity in the RoboSub and AUV community. We also hope to offer something new to the competition this year, and have fun as we put all our hard work to the test.
